Re: Job no. 596538 — Connectivity Credits Backend Software Engineering Consultant, Digital Impact Division (6 months, remote)

Dear Hiring Manager,

Connectivity Credits is moving from pilots to a production platform that links measured connectivity to incentives for providers, through **event-driven workflows, integrations and rule-based decisions**. That is the kind of backend I have built and operated: services that consume events, call external systems and must keep data correct while live traffic is running. I would like to provide that capacity for the next six months, working within the architecture your product and tech team sets.

Event-driven and distributed systems. At CodeBits I architected an event-driven microservices backend on **Apache Kafka, Docker and Kubernetes** for FIDA Uganda's case-management system, with gRPC between services. At MTailor I built a real-time two-way sync between MongoDB and Firestore on **Google Pub/Sub**, which let 20+ production applications move to GCP with zero downtime. Asynchronous, message-driven processing was the core of both.

Backend services, APIs and integrations. Six years of Node.js backend work. At Dr Wealth I extended backend APIs in **TypeScript** (Cloud Functions, Express.js) and ran jobs over 2 million records against the Morningstar APIs to keep customer prices current. I use **Python** for data and migration tooling (S3 to Google Cloud Storage at MTailor) and wrote the Node.js and Python SDK documentation other engineers worked from. I have also built **Web3 backends** for DeFi applications at Mind2matter, which is relevant to the digital value-transfer side of the platform.

Building for the contexts Giga serves. I am based in Kampala and have built for users at the edge of connectivity: a USSD service that let legal-aid providers in Uganda reach people on basic phones, backed by a Node.js service. The pilots in Kenya, Malawi and South Africa sit in my region and time zone, two hours ahead of Geneva, and I speak English and Kiswahili.

I have worked remotely and independently for five years, for US and Singapore teams, reporting directly to the CTO at MTailor and Mind2matter. I take a technical design, ask the questions early, and ship maintainable code. To be direct about where I would ramp: my TypeScript production time is shorter than my Node.js time, and I have not worked with a dedicated rules or workflow engine. I would close both in the first weeks against your existing MVP code.

My CV and financial proposal are attached. Thank you for your consideration.

Sincerely,
Isaac Mubiru
