Application — Senior Node.js Backend Developer (100% Remote Worldwide) · Bitfinex

Dear Bitfinex Hiring Team,

Bitfinex is looking for a backend engineer who can keep services **effortlessly smooth, responsive, and real-time** as the platform scales — and that is exactly the work I have spent the last five years doing. At MTailor I led the zero-downtime migration of **20+ production applications** from Parse/MongoDB to Firebase/GCP, building a live two-way sync between MongoDB and Firestore on **Node.js** and Google Pub/Sub that ran continuously under parallel production traffic. Nothing went down, and infrastructure cost dropped by ~\$5,000/month.

Your stack maps directly onto my core. I work daily in **Node.js and JavaScript** against **MongoDB**, and I have architected an event-driven **microservices** backend on Apache Kafka, Docker, and Kubernetes for FIDA Uganda's case-management platform. I design APIs with a security-first mindset and have a track record of moving fast in small, high-ownership teams — at Dr Wealth I ran scheduled jobs over **2M+ records** to keep real-time market data current, and at CodeBits I led a four-engineer team end to end.

I am based in **Kampala, Uganda (UTC+3)** and work fully remote, so a 100%-remote contractor arrangement suits me well. I am genuinely drawn to Bitfinex's small, technology-focused core and its bias toward autonomy and shipping — the environments where I do my best work. I would welcome the chance to bring real-time, high-availability backend experience to your team.

Best regards,

Isaac Mubiru
