Re: Experienced Software Engineer

Dear **Automatic Hiring Team**,

For the past four years I have worked exclusively across distributed, fully-remote teams — from MTailor in the US to Dr Wealth in Singapore. The work I am proudest of is the one I am still doing: leading the end-to-end migration of **20+ production applications** from Parse/MongoDB to Firebase/GCP with **zero downtime** on a live system, which cut roughly **\$5,000/month** in infrastructure cost. I want to keep doing exactly that — shipping carefully on systems real people depend on — at a larger scale, on the open web. That is why I am writing to Automatic.

Your role asks for engineers comfortable across **several languages, frameworks, and paradigms**. I have shipped production code in Node.js, Python, JavaScript, Go and Rust, plus Web3 and React/React Native front ends. I treat a language as a tool, not an identity, which is also why the PHP/WordPress side of this stack reads as a short ramp rather than a barrier. My track record is picking up unfamiliar stacks fast and then making the rest of the team productive in them — when MTailor adopted Firebase, I wrote the SDK documentation for the other engineers and trained the Ops team on the new dashboard and backup procedures. Given the JD frames PHP as something you grow into, I would arrive ready to do the same with Gutenberg and the WordPress ecosystem.

On **scale**: at Dr Wealth I built ad-hoc jobs querying **over 2 million Firestore records** to keep customer stock prices current from the Morningstar APIs. On **quality obsession**: the zero-downtime migration above ran on a live system reporting to the CTO — achieved with real-time two-way MongoDB↔Firestore sync over Google Pub/Sub rather than a risky big-bang cutover. And on the **layers above and below**: at CodeBits I architected a microservices backend for FIDA Uganda's case-management platform on Apache Kafka, Docker and Kubernetes, with a USSD service talking to a Node.js backend over gRPC — owning it from architecture down to deployment.

Automatic also weights AI integration and product impact, both of which I have shipped. I integrated OpenAI and Google Vision OCR over the WhatsApp Business API for a healthcare prescription-intake pipeline, and at MTailor I built a 3D visualisation feature (ffmpeg video overlay) plus an Express Shipping flow that added **\$40 in revenue per order** — small, detail-driven features that compounded into real numbers. My code lives at github.com/zac-09.

I have been intentional about where I apply, and a globally-distributed, output-over-location company building one of the largest platforms on the web is exactly the team I want to contribute to from day one. I would welcome the chance to prove the fit on a trial project.

Best regards,

Isaac Mubiru
