Cal.com — Foundation Team

RE: IC4 SENIOR FULL-STACK ENGINEER (FOUNDATION)

I spend my days keeping live production systems running while they change underneath me. At **MTailor** I led the end-to-end migration of 20+ applications from Parse/MongoDB to Firebase/GCP with **zero downtime**, reporting directly to the CTO and cutting roughly \$5,000/month in infrastructure cost. The Foundation role — embedding with product teams, reviewing high-risk PRs, and debugging the intricate, time-sensitive logic that holds a scheduling platform together — is exactly the kind of "keep the ship moving" work I want to do next.

The part of your job description that maps most directly to my experience is **debugging intricate systems** — the round-robin-across-time-zones class of bug. During that MTailor migration I built a **real-time, two-way sync between MongoDB and Firestore** over Google Pub/Sub, with idempotency to keep both stores consistent while live traffic hit both. That is the same discipline a scheduling engine demands: distributed state, ordering, and correctness under concurrency, with no room for data loss.

On the stack, I am a strong match where it counts and honest where it doesn't. I have **5+ years of production Node.js/TypeScript** and ship React/Tailwind front-ends end to end; I architected an **event-driven microservices backend with Apache Kafka, Docker, and Kubernetes** at CodeBits, where I also led and reviewed a team of four. My databases have been Mongo and Firestore with solid SQL, so Postgres/Prisma and Next.js/tRPC are a short, deliberate ramp on top of foundations I already use daily — not new territory. Cal.com being **open-source** is a draw, not a footnote: my work lives at github.com/zac-09, and I value building in the open where the code speaks for itself.

One thing I want to surface early and directly: I work from **Kampala (UTC+3)**. I already collaborate async with a US team at MTailor, so a defined overlap window plus clean handoffs is well within reach — but I would like to confirm the Americas-timezone and on-call expectation fits a UTC+3 engineer before we both invest further. If the Foundation role genuinely supports global remote, I would be glad to go deep with your team.

Best regards,

Isaac Mubiru
