2026-04-27

To the Holepunch team —

A P2P stack designed to eliminate traditional server infrastructure, plus 1,500+ public npm modules to extend it — that's why I'm applying for the Senior Node.js Software Engineer role.

I'm a Senior Node.js Engineer with 5+ years of production work across MTailor (US-remote, reporting to the CTO) and a 4-person team I led at CodeBits in Uganda. Three things I'd bring on day one:

Production-scale Node.js. At MTailor I led the zero-downtime migration of **20+ apps** from Parse/MongoDB to Firebase/GCP — including a real-time two-way sync between MongoDB and Firestore using **Node.js** and Google Cloud **Pub/Sub**. Dual-writes ran for four weeks of parallel production traffic before cutover. Saved **\$5K/month** off AWS in the process.

Modular, distributed thinking. I architected a microservices backend for FIDA Uganda using **Apache Kafka, NATS Streaming, gRPC, Docker, and Kubernetes** — multi-tenant case management for legal-aid NGOs. The pieces are different from Hypercore, but the discipline (modular packaging, async event boundaries, replicating state between independent nodes) is the same muscle.

Honest about the P2P gap. I haven't shipped P2P or DHT-based systems in production. What I have is distributed-systems work that prepared me for it — and I've been reading the Hypercore and Keet sources as my Q2 deep-dive. I'd bring the same builder posture I've shown at MTailor and CodeBits: ship, observe, iterate.

I work fully remote from Kampala, Uganda (UTC+3). 3+ years of async US-remote at MTailor — Loom + written specs, twice-weekly sync windows, reporting directly to the CTO.
