Senior Fullstack Engineer — Accounting (Node.js/TypeScript · React)

Dear Hostaway Hiring Team,

For the past four years at MTailor I have owned the part nobody wants to break: I led the end-to-end migration of **20+ production applications** from Parse/MongoDB to Firebase/GCP with **zero downtime**, reporting directly to the CTO. Your accounting team is building a white-label trust-accounting product from scratch — a greenfield system where correctness and auditability are not features but the whole point — and that is exactly the kind of high-stakes, get-it-right-the-first-time work I have spent my career doing. I want to apply that same discipline to a 0→1 product, with full timezone overlap from EAT (UTC+3).

I have been following Hostaway as one of the clear winners in PropTech SaaS — profitable, fully remote, and hiring senior engineers across EMEA rather than chasing headcount. That signals a team that values output over postal code, which is exactly the kind of place I want to do my best work. Building the accounting backbone other parts of the platform depend on is the sort of leverage I want my next role to have.

The role maps cleanly onto what I have shipped. **Node.js/TypeScript + React fullstack:** I build Node.js backends and ship customer-facing React UIs in the same roles — at Dr Wealth I extended Firebase Cloud Functions/Express APIs and added responsive React pages to a real-time market-pricing PWA. **Backend that integrates data reliably:** I built a real-time two-way MongoDB↔Firestore sync via Node.js and Google Pub/Sub, and at Dr Wealth ran jobs over **2M+ Firestore records** to keep customer prices accurate against Morningstar APIs — the same correctness-under-load mindset a ledger demands. **Scalable, auditable systems:** I architected a microservices backend on Apache Kafka, Docker, and Kubernetes at CodeBits.

I want to be straight on one thing: I have not built accounting or ledger software, and your posting lists that domain as a plus rather than a must. What I bring is the adjacent fintech discipline — keeping financial data correct and current at scale — plus a track record of picking up new domains fast on greenfield builds. I learn the domain by building it, and I would rather earn that expertise on your product than overstate it now.

You can see how I work at github.com/zac-09. I would welcome the chance to talk through how I would approach the trust-accounting MVP.

Best regards,

Isaac Mubiru
