StackBlitz — Bolt.new Engineering Team

Re: Senior Full Stack Engineer

Hi StackBlitz team,

Bolt.new compresses the loop from idea to deployed app — that is the same leverage I try to create as a full-stack engineer. The reason the product resonates with me is specific: I have spent the last four years removing the friction between **working code** and **shipped product**, and that is exactly the gap Bolt.new is closing for every developer on the internet.

At **MTailor** I led the zero-downtime migration of **20+ production apps** from Parse / MongoDB to Firebase Cloud Functions Gen2 and Firestore — a live Pub/Sub-based sync pipeline kept the system running for end users the entire time, and the migration cut meaningful monthly infrastructure cost. That project is my answer to anything involving serverless functions, real-time data, and shipping infrastructure change without breaking users — which maps directly to the role: **APIs, serverless functions, performance optimization, distributed systems**.

On the AI side: I built a **healthcare WhatsApp chatbot** that uses OpenAI + Google Vision for prescription OCR. The hard part was never the model — it was the guardrails, the retries, the deterministic pieces wrapping the non-deterministic ones. Bolt.new has that exact problem at much higher leverage, and I want to work on the side that ships it.

Stack-wise I am native on **Node.js, TypeScript, React, Firebase Cloud Functions, and Pub/Sub**, with microservices work in Kafka / Docker / Kubernetes at CodeBits. Two honest gaps: I have not shipped production Cloudflare Workers or Remix — both are small ramps from the adjacent tooling I already use, and I am building a Bolt.new-generated demo before the first conversation so I show up with opinions on the product, not just the job post.

I am based in Kampala (EAT, UTC+3) and fully remote. Happy to walk through any of the above — the MTailor migration, the chatbot, or the Bolt.new demo — on a first call.

Thanks,

Isaac Mubiru
