Dear Bright Data Hiring Team,

I'm applying for the **Experienced Backend JavaScript Developer (Worldwide)** role. I've spent the past six years building Node.js backend systems — and Bright Data is a deliberate choice: you run network infrastructure at a scale where backend engineering and protocol-level thinking meet, which is exactly the intersection where I do my best work.

Your posting asks for *"end-to-end feature development, from conception to production."* That is how I already operate. At MTailor (San Francisco, remote), reporting directly to the CTO, I led the zero-downtime migration of 20+ production applications off Parse/MongoDB — designing a real-time two-way sync pipeline between MongoDB and Firestore using Node.js and Pub/Sub so both systems served live traffic in parallel until cutover. I also consolidated our infrastructure off AWS, cutting \$5,000/month in costs. I own systems, not tickets.

On your stack: Node.js, MongoDB, and Express are my daily tools, and I've architected microservices on Kubernetes and Docker with Apache Kafka. I've run three message brokers in production — Kafka, NATS Streaming, and GCP Pub/Sub — so RabbitMQ's semantics (acks, redelivery, idempotent consumers) are concepts I've already debugged under load. On the networking side, I've built WebSocket-based real-time systems, gRPC services over HTTP/2, and a USSD gateway serving feature phones — working below the HTTP layer is familiar ground I'm keen to go deeper into at a company where the network *is* the product.

A practical note: I'm based in Kampala (UTC+3), which overlaps the Israel team's working day almost perfectly — real-time collaboration, no async lag.

Best regards,

Isaac Mubiru
