Application — Backend Engineer (Technology · Fully Remote) · Sarwa Digital Wealth

Dear Jad and the Sarwa technology team,

I will start with the thing your first requirement line asks about. My production depth is **Node.js**: six years of backend services, including the migration of **20+ live applications** from Parse/MongoDB to Firebase/GCP at MTailor with zero downtime, reporting to the CTO. **Python** is my second language, used for migration tooling and SDK documentation on that same programme, and I write **Go** at an intermediate level. I have not shipped Django in production and I will not claim otherwise. What I would bring from day one is the part of your posting that takes years rather than weeks to learn.

Your role is built around **microservices**, **event sourcing**, **data flows** and **third-party integrations** on a platform that moves people's money. I architected an event-driven microservices backend on **Apache Kafka**, Docker and Kubernetes for FIDA Uganda's case-management system, and at MTailor I built a real-time two-way sync between MongoDB and Firestore on Google Pub/Sub that ran under parallel production traffic for months. That work is idempotency, redelivery, ordering and reconciliation, which is the same discipline that keeps a funding or trading ledger consistent. At Dr Wealth I kept prices current for retail investors by running scheduled jobs over **2M+ Firestore records** against the **Morningstar** market-data APIs, so I know what an external financial feed does to your freshness ceiling and your rate-limit floor.

I have owned projects from infancy to production in small, remote, cross-functional teams across the US, Singapore and Uganda, and I am comfortable being the person who turns a product requirement into scope, architecture and a shipped service. Kampala is one hour behind Abu Dhabi, so a remote-first team with an optional office is a natural fit. Before a technical conversation I will share a small Dockerised Go or Django service with PostgreSQL and tests on github.com/zac-09, so you can judge my ramp speed on your stack directly rather than on my word.

Sarwa is profitable, regulated and still led by its founders, and the problem you are solving, affordable investing for people the industry ignored, is the kind of work I want to put the next several years into. I would welcome a conversation.

Best regards,

Isaac Mubiru
