Dear Chronograph Team,

I'm applying for the **Senior Software Engineer** role. What draws me to Chronograph specifically is the problem class: financial data where being wrong is not an option. That is the kind of engineering I've done my best work in, and doing it for the platform that Carlyle- and Nasdaq-backed private capital funds rely on is exactly the stakes I want.

Your posting asks for someone to *"own and lead technical projects from product ideation to successful execution."* At MTailor (San Francisco, remote), reporting directly to the CTO, I led the zero-downtime migration of 20+ production applications off Parse/MongoDB — architecture decisions, data-model redesign, a real-time two-way MongoDB↔Firestore sync pipeline built on Node.js and Pub/Sub, and a phased cutover with both systems serving live traffic. Before that I led a team of four engineers at CodeBits, and I've kept the mentoring habit since: documentation, code review, and training operations teams to run what I build.

Your nice-to-have — *"computation-heavy services where accuracy and performance are imperative"* — is my strongest card. At Dr Wealth (Singapore, fintech), I kept live stock prices current across 2M+ Firestore records fed from Morningstar APIs, with batched, indexed jobs tuned so paying customers never saw stale market data. Financial-data errors are trust errors; I design for verifiability first.

On stack, candidly: TypeScript and Node are my daily tools. My schema-design experience is real — the migration required re-modeling live production data mid-flight — and I'm SQL-proficient, though my production database depth is NoSQL-first. My API contracts in production have been REST and gRPC rather than GraphQL; I'm actively closing that gap and expect the contract-first thinking to transfer directly. Your posting says to apply even without every criterion — I'm taking you at your word and telling you exactly which ones those are.

I'm based in Kampala (UTC+3), fully remote, with years of experience embedded in US and Singapore teams.

Best regards,

Isaac Mubiru
